RCB Player API Regression Bug Report

Reference: APP-API-REFERENCE (1).md
Collection requests: 111; app-used routes: 57 unique (86 examples).
HTTP/business passes: 111; failures: 0; configuration warnings: 3.

BUG-001 - Live stake-rate payloads omit keys expected by the app [HIGH; CONFIRMED]

- Request 51 (main market, HTTP 200) is missing: choice_sp_dp_tp, odd_even, two_digit_panel, half_sangam_b, red_bracket, digits_based_jodi.

- Request 52 (Starline, HTTP 200) is missing: panel_group, choice_pana_sp_dp, odd_even, two_digits_panel.

- The supplied reference documents these app-read keys in sections 5.6 and 11.2; it notes that missing keys interrupt later rate loading.

Recommendation: Read each rate independently and source per-player min/max from my-game-rates, or return all app-required keys with a verified compatibility contract.

BUG-002 - Profile response includes the full settings document [HIGH; CONFIRMED]

- Request 3 returned settingData[0] with 40 fields; 30 are outside the app-required allowlist in reference sections 4.3, 4.9 and 11.5.

- Sensitive/internal fields present in the live response shape: email_id, mobile, support_whatsapp_cursor, onboarding_whatsapp_cursor. Values are redacted in reports.

Recommendation: Return an explicit allowlist of settings needed by the player app rather than the complete settings document.

CFG-001 - Support contact channels are not configured [LOW; CONFIGURATION]

- Request 16 returned HTTP 200, success=2, with empty WhatsApp/call contact lists.

- The developer reference documents success=2 for the no-configured-contact case; this is not an API contract failure.

Recommendation: Configure at least one current support contact if the product expects the Call Support screen to work.

INFO-001 - Payout-sender email was not reproduced in the withdrawal response [INFO; NOT_REPRODUCED]

- Request 73 returned 10 withdrawal row(s); none contained payout_sending_by.

- The reference section 11.3 issue remains unverified for other pages or withdrawal records.

Recommendation: Keep the serializer privacy regression check and verify additional pages/known payout records in a controlled environment.

INFO-002 - Geo-header behavior was not exercised with restriction enabled [INFO; NOT_TESTED]

- Live setting geo_restriction_enabled=0.

- The reference section 11.1 describes missing geo headers as a latent issue when geo restriction is enabled.

Recommendation: Test the geo-restricted path in a non-production environment after the client header handling is corrected; do not enable the live gate for this regression run.

SCOPE-001 - Full collection run includes app and legacy/unused examples [INFO; SCOPE]

- Executed 111 collection examples. The developer reference identifies 57 app-used routes, represented by 86 collection examples.

- Retired and unused examples remain in the all-suite regression run and are asserted against their documented status/body contracts where specified.

Recommendation: Use --suite app for APK-used route coverage or --suite legacy for compatibility/deprecation checks.

Coverage limitations

Sangam 344, geo restriction enabled behavior, and other withdrawal-history pages were not validated by this run. See the Markdown bug report for details.
